

Custom Website Integration — Developer Guide

LazyChat · Generated September 26, 2026

This document is for the development team of the connected website. The integration needs **two APIs from the website** and **webhooks from the website to LazyChat**.

Two ways to set this up: fill in the API details on the LazyChat Custom Integration page, or send your own API documentation to the **LazyChat Customer Support team** and we'll wire everything up for you. The values shown below in angle brackets (<...>) are examples — replace them with your real endpoints and tokens.

How it works

- Initial inventory sync** — LazyChat fetches your website's products once to build the catalog. Provide a Products API (e.g. yourwebsite.com/api/products) returning the LazyChat product format, and save it in the form below.
- Product change sync** — When a product is created, updated or deleted on your website, POST it to the webhook endpoints in the flow cards below (copy the URL and Bearer token from each card).
- Order creation** — When LazyChat AI generates an order, it POSTs the order payload to your Order Create API (e.g. yourwebsite.com/api/order/create).

Sync flows & webhook endpoints

Step 2a — Product Create / Update Sync Your website → LazyChat

- When a product is created or updated on your website, send a POST request to the endpoint below.
- Headers: Authorization: Bearer <token below>, X-Webhook-Topic: product/create or product/update.
- Body: the single product JSON in LazyChat product format (see reference at the bottom).
- Use a 5s timeout — any response status other than 401/403 means the webhook was received.

Webhook Endpoint (POST)	https://flow.lazychat.io/api/exec/flows/6ab2d326e3228b6bab0528f2/wj-WCTQz40o1
Auth Token (Bearer)	3de3b8bbe6901dfb51f5f03f93c8ec2c499097716fa450b0f61ff72f818f1582

Step 2b — Product Delete Sync Your website → LazyChat

- When a product is deleted on your website, send a POST request to the endpoint below.
- Headers: Authorization: Bearer <token below>, X-Webhook-Topic: product/delete.
- Body: {"product_id": <your website's product id>}.
- Use a 5s timeout — any response status other than 401/403 means the webhook was received.

Webhook Endpoint (POST)	https://flow.lazychat.io/api/exec/flows/6ab2d326e3228b6bab0528f2/A0TceD0_sz43
Auth Token (Bearer)	c8e2a7a11352f388ec2d1774a4d3f2206fddccffd7c701c66a49be3ce8c5c055

Step 3 — Order Sync

LazyChat → your website

- When LazyChat AI generates an order, this flow POSTs the order payload to your Order Create API (configured below).
- Your endpoint should accept the order payload format shown in the reference section.
- Authentication uses the Authorization header you configure on the Order Create API.

Step 1 — Product Fetch API (your website provides)

Method	GET
URL	https://yourwebsite.com/api/products

HEADERS

Key	Value
Authorization	Bearer <your-products-api-token>

QUERY PARAMS

Key	Value
page	1
per_page	100

REQUEST BODY (OPTIONAL)

Not typically required — most Products APIs are a simple GET. Add one here only if yours expects a request body.

EXPECTED RESPONSE FORMAT

```
